Novel transforming growth factor (TGF)-beta 1 binding reagent which comprises r150 protein which acts as accessory receptor of TGF-beta, useful for negatively modulating TGF-beta activity, and thus for

The invention relates to novel transforming growth factor (TGF)-betal binding reagent which comprises a glycosylphosphatidyl inositol (GPI)-anchored TGF-beta binding protein referred to as r150 which acts as an accessory receptor of TGF-beta. The invention is used for negatively modulating TGF-beta activity, and thus for treating conditions characterised by overproduction of TGF-beta, such as cancer. Antisense molecules of the invention are used for increasing TGF-beta availability and increase graft success. The present sequence is human r150 protein according man

CC The invention relates to isolated nucleic acid molecules encoding CD109 CC polypeptides. These nucleic acid molecules include the human cDNA CC sequences comprising CD109 K1, CD109 K1-H7, CD109 K15 or their variants. CC CD109 is a novel member of the alpha2 macroglobulin (alpha2M)/C3, C4, C5 CC family of thioester-containing proteins. The CD109 polypeptides can be expressed by standard recombinant methodology. The CD109 nucleic acid, CC CD109 polypeptide or its mimetic, or the anti-CD109 antibody is useful CC for treating or detecting a disease or disorder, e.g. conditions CC associated with endothelial activation, platelet activation, activation of the complement system, quantitative or qualitative abnormalities CC and of the complement system, quantitative or qualitative abnormalities CC of platelet function, increased or impaired platelet aggregation and CC activation, increased or impaired activation of the coagulation or fibral activation of the coagulation and or cfibrinolytic systems, or impaired activation of the coagulation and/or CC complement system, or impaired activation activation. These care also useful for treating cardiovascular disorders, stroke, myocardial cc infarction, thrombosis, embolism, peripheral vascular disease,

The CD109 nucleic actor their antisense nucleotide sequence are useful in gene therapy for treating these conditions. The present sequence represents the human CD109 K15 cDNA sequence.

The invention relates to isolated nucleic acid molecules encoding CD109
CC polypeptides. These nucleic acid molecules include the human cDNA
CC sequences comprising CD109 K1, CD109 K1-H7, CD109 K15 or their variants.
CC CD109 is a novel member of the alpha2 macroglobulin (alpha2M)/C3, C4, C5
CC family of thioester-containing proteins. The CD109 polypeptides can be
ce expressed by standard recombinant methodology. The CD109 nucleic acid,
CC CD109 polypeptide or its mimetic, or the anti-CD109 antibody is useful
CC for treating or detecting a disease or disorder, e.g. conditions
CC associated with endothelial activation, platelet activation, activation
CC associated with endothelial activation, platelet activation of Tlymphocytes
CC and of the complement system, quantitative or qualitative abnormalities
CC and of the complement system, quantitative or qualitative abnormalities
CC of platelet function, increased or impaired platelet aggregation and/or
CC fibrinolytic systems, or impaired or increased immune activation and/or
CC are also useful for treating cardiovascular disorders, stroke, myocardial
CC infarction, thrombosis, embolism, peripheral vascular disease, thrombocytopenia, thrombocythemia, autoimmune diseases, organ transplantation, or bone marrow transplantation. The CD109 nuc or their antisense nucleotide sequence are useful in gene them

The invention is used for negatively modulating TGF-beta activity, and thus for treating conditions characterised by overproduction of TGF-beta, such as cancer. Antisense molecules of the invention are used for increasing TGF-beta availability and increase graft success. The present sequence is a gene encoding human r150 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel transforming growth factor (TGF)-beta 1 binding reagent which comprises r150 protein which acts as accessory receptor of TGF-beta, useful for negatively modulating TGF-beta activity, and thus for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 7; Page

```
CC polypeptides. These nucleic acid molecules include the human cDNA CS sequences comprising CD109 K1, CD109 K1-H7, CD109 K15 or their variants. CC CD109 is a novel member of the alpha2 macroglobulin (alpha2M)/C3, C4, C5 CC family of thioester-containing proteins. The CD109 polypeptides can be CS expressed by standard recombinant methodology. The CD109 nucleic acid, CC CD109 polypeptide or its mimetic, or the anti-CD109 antibody is useful CC for treating or detecting a disease or disorder, e.g. conditions CC associated with endothelial activation, platelet activation, activation of the coagulation or fibrinolytic systems, activation of T lymphocytes CC and of the complement system, quantitative or qualitative abnormalities CC of platelet function, increased or impaired platelet aggregation and CC activation, increased or impaired activation of the coagulation and/or CC fibrinolytic systems, or impaired or increased immune activation. These CC are also useful for treating cardiovascular disorders, stroke, myocardial cinfarction, thrombosis, embolism, peripheral vascular disease, organ cc transplantation, or bone marrow transplantation. The CD109 nucleic acids CC or their antisense nucleotide sequence are useful in gene therapy for CC crating these conditions. The present sequence represents the human CC CD109 K1 cDNA sequence.

The invention is used for negatively modulating TGF-beta activity, and thus for treating conditions characterised by overproduction of TGF-beta, such as cancer. Antisense molecules of the invention are used for increasing TGF-beta availability and increase graft success. The present sequence is a gene encoding human r150 profess

CC for treating or detecting a disease or disorder, e.g. conditions
CC associated with endothelial activation, platelet activation, activation
CC of the coagulation or fibrinolytic systems, activation of T lymphocytes
CC and of the complement system, quantitative or qualitative abnormalities
CC of platelet function, increased or impaired platelet aggregation and
CC activation, increased or impaired activation of the coagulation and/or
CC fibrinolytic systems, or impaired or increased immune activation. These
CC are also useful for treating cardiovascular disorders, stroke, myocardial
CC infarction, thrombosis, embolism, peripheral vascular disease,
CC transplantation, or bone marrow transplantation. The CD109 nucleic acids
CC or their antisense nucleotide sequence are useful in gene therapy for
CC Creating these conditions. The present sequence represents the human
CC CL109 K1 cDNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          polypeptides. These nucleic acid molecules include the human cDNA sequences comprising CD109 K1, CD109 K1-H7, CD109 K15 or their variants. CD109 is a novel member of the alpha2 macroglobulin (alpha2M)/C3, C4, C5 family of thioester-containing proteins. The CD109 polypeptides can be expressed by standard recombinant methodology. The CD109 nucleic acid, CD109 polypeptide or its mimetic, or the anti-CD109 antibody is useful
